

Cumulus Linux

Unleashing the Power of Open Networking

Great Networking for L2, L3 and Overlays

Cumulus Linux, the operating system for open networking, helps organizations of all sizes realize the full promise of the software-defined data center. With over 1 million switch ports in service, Cumulus Networks® customers range from small businesses to one of the world’s largest cloud operators.

Highly-engineered networks are expensive and constrain innovation

Vendor-locked network infrastructure is difficult to evolve, and often requires manual provisioning. There are limited opportunities for IT to innovate. In response to this, the world’s largest cloud operators developed a new approach to networking. Now open networking is available to all.

“The time-scale for business progress has collapsed; IT has to respond.”

Peter Christy, 451 Research

Open Networking provides choice and improved economics

As a true Linux distribution with hardware acceleration, Cumulus Linux enables affordable capacity and consistent automation and orchestration across compute and networking. Customers choose platforms from an extensive HCL of over 24 switches.

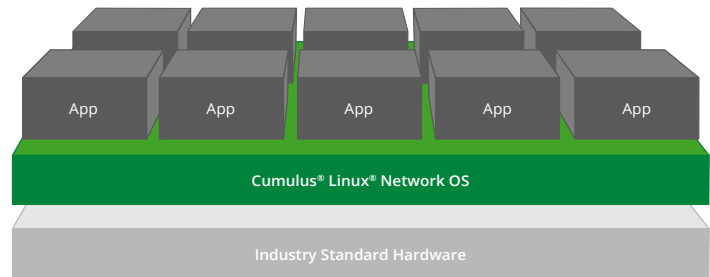

- Layer 2, Layer 3 and overlays
- Zero-touch provisioning
- Linux tools run natively

The Best Infrastructure for Your Business

Choose the hardware, software, and management and automation tools that best fit your application needs. Cumulus Linux is supported on an ever-increasing number of industry-standard platforms. cumulusnetworks.com/hcl

Build a Better Network

Design your network like Google, Amazon and Facebook. cumulusnetworks.com/get-started

Open Unlock Your Choices

- Disaggregation
- No vendor lock-in
- Linux community resources

Responsive Serve the Business Better

- Automation with Linux tools
- Ease of scaling
- DevOps innovation

Affordable Save as You Grow

- Bare metal CapEx
- OpEx savings
- Open solutions ecosystem
